My songs There are no folders / library / playlists.a. Please make sure you have all the folders with music actually controlled in the PowerMP / Library / Folders.Q music settings. Amplified bass are distorted above Bluetooth.a. Please review the PowerMP settings / / Direct Controllo del Volume (DVC) Opzioni. If nowadays Piegato like most music consumers, Â time you have the chance that you have made the switch from personal iTunes biblioteche to streaming servizi such as Spotify, Google Play Music di Apple Music. Those Applicazioni has increased enormously in recent years, thanks to the free options for the Streamate of Muziek Applicazioni who as Spotify offering the piracy of Music Morire spreading, in the entire 19,000 NEL CORSO the industry. And although the range of Spotify di Google for most listeners can be easy, cheap and handy, Â an argomento a one The best way to listen to music in 2017 control is still on your local library. Most smartphones nowadays (excluding Google's pixel line) are equipped with microSD card slots for cheap, expandable storage and an easy way to locate all your music on one place. If you have your life for the hours worked on the accurate making the iTunes library perfect labels, album descriptions, perhaps even texts that are blocked in your metadata, you may not be ready to continue for the cloud. If this is the case, you need a large multimedia player to participate in your collection - and where else is aimed at Poweramp, one of the oldest musical and reliable applications available in the game store. Even if you could know exactly what you start with Poweramp, especially if you were one of the first users of Android, there is always the possibility that you don't know exactly how full this application is really. So sit down, vomiting good headphones and download the free poweramp trial version. It's time to take a look at one of the most robust music apps available on Android. Appearance and the appearance of Powamp is rather dated in all honest. Most modern musical applications are equipped with a type of material design, the central theme with which Android has dealt from 2014. Compared to an application like Google Play Music or Pulsar, the app feels as if it generally belongs At Gingerbread. Good news for those of us who prefer design-oriented applications: Poweramp has had an integrated themed engine in the app. Personally I didn't wait too long with the installation of a free material oriented to my player. The skin I have chosen, offered both material light options, and did it well, so the application looked like a lot more modern. It's not perfect - you will not find navigation menus or other sliding material options - but poweramp colors and icons were both yacked and definitely look better than before. A quick search in the Google Play Store will shake dozens of free or cheap themes available for the platform, and I could not be happier. Most themes don't make much more recently coloring the application, but which can mean a long journey for poweram creation as an application made for 2017. It is also interesting to note that PowerMP 3 is currently in Alpha tests and yes You can download the latest version within the current PowerMP app settings. Although it contains a series of new features, including a relaxed audio machine and support for third-party plug-in, the actual images of the app remain largely the same. Navigate from the unfortunately app I found it by browsing a mixed bag through the application. First, the application seems to ignore the main rules of Android: the Back button should always return to the previous screen. In the case of the Poweramp, however, the recovery button is frustrating inconsistent. On the 'Play Now' screen, you will be pressed on the main screen by pressing the Back button. To return to my library with the numbers, I have to click on the left right of four buttons at the top right of the screen. As soon as there is there, the app gives me the choice to select the music from a file browser or from my library, a view more iTunes to all my albums. If I sit on this screen, I will be supported at the time-playback display when I press the back. Similarly, by clicking the back works correctly from the settings. I don't doubt that few weeks I spend with poweramp as my only music player would give me the time to get used to the functions and navigation of the But readers should know the first hours that exploring the app can cause a number of frustrating navigation experiences. The bit of a leather curve to know exactly what causes of action. For example, if you want to change metadata from an album, not only can you hold the illustration of the album. You need to enter the album and then press a number for a long time to find the option for info. From there you can change each song separately, but as you might advise, changes to mass-modes in a slow process. I would like to see that in the future album information is modified by Poweramp, perhaps in the full version of PowerMP 3. Support for files, functions and equalizers Here we come to bread and butter where Poweramp is actually great. App supports almost every type of audio-based files that you might ever wait from .M4a .mp3 file standard (M4A is the type of regular file that you will find in the iTunes Store) for advanced file types, including Lossless FLAC support Street (on Windows) and .aiff (on Mac). At which file also types your library, you can almost ensure that PowerAmp has problems with it. From the game now screen you can access most of the best PowerMP functions. First of all, it has a fairly large equalizer, with several presets for your listening pleasure. The low options, for example, actually assured that the bass stands out on "Untitled 03" by Kendrick Lamar without drowning the text of Lamar while the preset music is turned on during the "ball and biscuit" of The White Stripes Nuts brought In the guitar gap from White l 'I'm not sure I've ever noticed when I listened to the song in my car. Both tracks have remained clean and non-deformable while using the EQ. It was impressive and every preset is also modifiable individually. You can absolutely find a setting you like, whether you listen through speakers or headphones. In addition to the equalizer, you will find some tone and volume options, including a Virtual Volume button (if you do not want to use the volume button), a possibility of music of the game in monomodus (useful for if you want plugs for Ears Sharing with someone next to you) and a balance button. These functions are not as rich as the equalizer, but they are useful, especially on telephones that do not have options for mono playback, or if the headphones come out of balancing. If you press the Menu button in the upper right corner, you will receive options for predefined settings, display settings and much more. Not everything is worth mentioning here, so instead I will emphasize some unique features that you won't find with each player. First of all, there is a sleep timer. Other players have this, but I really like having an accessible via the screen now. For example, if you want to use the same function in Google Play Music, you need to minimize the current number, extend the navigation tray, go to Settings and then find the sleep timer. Poweramp is also a little rather rich in functions than Google. For example, you can choose to play the last song in the end so that you don't get confused by sudden disappearance if you try to fall asleep from sound. From someone who uses music and podcasts fall asleep almost to fall asleep at night, I love this option available. Another great option that is hidden in the menu is lyric research; However, unless the texts are already written in the metadata of the selected track, you need to install MusixMatch, a separate application to make the function effectively to use. Fortunately, Musixmatch is a free download naturally worth noting what the application doesn't. You can not download music on it in the cloud, as you can with Google Play Music or Apple Music. This is a strictly wired problem, for example as the music has succeeded when everyone possessed an iPod. You will not find any online radio stations, such as what you would get from Pandora, and certainly not sign up for a monthly subscription to stream music, as you might with Spotify. For some people this could be a good thing, making Poweramp a usable, full of functionality app without emitting in the added content that they really don't need or want. For others this could be a little too much work in 2017 to get music on the phone. The average consumer just wants to listen to music from their favorite groups and if terms such as bitrate or metadata doesn't mean much to you, it may be better looking for an application like Spotify. Download music to listen to the world, all functions and settings in the world does not matter if a music app is not good where you want: playing music. Fortunately for those of you looking for a solid musical application, poweramp supplies to kicks. The functions I have described above - the file support specifically robust - do poweramp a dream if you only need a local musical application with an advanced set functions and hard skin options to test the PowerMP power engine, CE L 'I exccessed with three different ones. Album: A form of a moon polo of Radiohead, Kendrick Lamar unmasted uncontrolled and the classic elephant from The White Stripe. In all three cases I used two separate album copies - one from iTunes, at a speed of 192 KB / SE 320 KB / s depending on the disc, and another in FLAC format, torn from a CD, somewhere between around 700 and 900 kb / s. If you have never listened to the lossless before, you know that the sound quality difference depends greatly on the quality of the speakers or headphones are used for listening to music. For example, playing music without loss through the speaker on my Galaxy S7 board does nothing but the compressed files I received from iTunes. Also remember that without loss of files have not been compressed, which means that a single song usually weighs on double megabyte digits, while Lossy files are usually about 4-6 megabytes, depending on the length of the song. With that technical jargon off-road, here's what I thought of listening to music: actually it was quite good. Listening to a nice pair of Sony headphones, I was undoubtedly I could see the difference between the two types of files. In particular in the case of Radiohead, I noticed several aspects of songs that I had never found before listening through Bluetooth speakers or while driving. And as I already said earlier on The White Stripes, guitar work really drops in that album if I listen to loss. I would also like to view something like ICKY thud or the first solo album from white in the application. One thing I can see: Kendrick's album sounded crunchy in .flac, but the difference between the two was not as big as in the case of white strips or radiohead. I suspect this is because the album, as the title makes it clear, is not mastered, and not because the application is not able to manage the low scratch hip hop.nog another thing I have Noted: Notifications interrupt the music instead of volume lowering such as Google Play Music. This can be changed in the audio settings below, but because it is disabled by default, I found it worthy of note. Cost poweramp has a free trial period, as well as something State interest in the question, then I recommend checking the application. The trial version is not supported by advertising and none of the functions is blocked behind a payment wall, so it's really a great way to get used to the apps, if you are interested in their use, but reluctant to the whole amount in cash. The unlocked version of the application that gives a fresh \$ 3, 99, but this is everything. There are no monthly or annual costs, you will never see an ad and, according to the app description on Google Play, there is no more paying for PowerMP 3.0 when this creature leaves Alfa definitive. Let the poweramp thoughts, it is not surprising, not perfect. The application does not meet the modern design guidelines of Android, can be a bit fussy in operation and that it does not have the same comfort of cloud-based musical applications. But if you're not completely ready to leave your iTunes library, or if you have a large number of audio files without loss of data you don't want to lose, then there is no better PowerMP music player. It is well supported, adapted and full of functions, and it only costs you a one-off \$ 3, 99, no in-app purchases or advertisements that can be found anywhere. If you are not ready to move to streaming, Powelamp is where you want to be. to be.
