# How to blur background of photo already taken on android

How to blur background of photo in android. How to blur background of photo already taken. How to blur background of a picture on android.

Chad VERZOSA smartphone You can also select your interests free access to our premium training; if you wish to learn how to blur the background to get professional looking images, you're lucky. We will show you different techniques to create fuzzy photo backgrounds that your friends wow. Start. [ExpertPhotography is supported by readers. Product connections on ExpertPhotography are reference links. If you use one of these and buy something we do some money. Need more information? Look how everything works here.] 7. How to blur the background in the portrait mode of the iPhone a few years ago, the achievement of bokeh (background blur) was only possible using a blur-effect application. But these days, you no longer need a blurred app if you have a new iPhone. The models from iPhone 7 Plus onwards now allow you to automatically obscure the background. The configuration works so well that the photos that use straight from a DSLR. So do you want to learn how to take pictures with blurred background on your new iPhone? First of all, go to the Camera app and touch the portrait mode at the bottom of the screen. Now, follow the prompt you see on the screen. The app could ask you to "sleep away ... or could tell you that there is "Nore the required light. " You are always standing by two to eight feet from the subject in a well-lit area to avoid any problem. Once everything is in order, the white bars you see on the screen should become yellow. Now, press the shutter and let the double cameras would dismain anything behind the subject. You can also turn on the lighting of the portrait to make you change the lighting around the subject. In vertical mode, see different icons above the shutter. All you have to do is choose anything from Studio Lighting to Stage Light to change the appearance of your image. Portrait lighting does not always work, but can add mood to your bokeh shots in some situations. So feel free to experiment with it every now and then. 6. Test Instagram focusing mode to blur all the all is all easier when you have a double camera. But what happens if you have a older model only with a camera? Use the blurred photographic app that you have not heard you: Instagram. In 2018, the social media app launched its own portrait mode called focus. The only difference is that you will not use two cameras. Instead, it relies on algorithms to separate the subject from the background. It is easy to use and it's almost as good as the iPhone version. To use the Focus mode, open the Instagram app and click on the camera icon in the upper left corner of the screen. Once you are in the stories, see different shooting modes at the bottom of the screen. Search for focus and touch. Once you indicate your camera in the subject, you will immediately see the blur of the background. The Focus mode is a part of the Instagram stories. But you can always save your portraits on your phone if you want. You can then publish them to other social media platforms and even upload them to your Instagram feed. 5. Use third-party apps for even more creative possibilities if you don't have a double camera and don't use Instagram, try a photo editor card instead. There are many options there outside, but what I recommend adding blur is Tadaa SLR. Tadaa SLR offers a variety of blurred effects for your photos, similar to what you can create on a DSLR camera. It has a blur of the normal background, but also allows you to create circular (radial) and linear circular blurs. Open the photo in Tadaa, and see an interface like your native camera app. All you have to do is press the shutter button at the bottom Screen to take an image. Once Tadaa captures the image, you will ask you to mark the subject with a mask. Using your finger, "Paint" on the object you want to keep strong. It detects the edges so as not to have to be super precise. But if you make a mistake, you can always touch the rubber icon To make changes. You can also enlarge to make sure you cover the IL details. When you did, click Next and adjust the opening to change the quantity of background blur. If you want to use the circular or linear blur, you can skip the masking process completely and press Next. The app will therefore take you to another interface. Here you can choose the two other blurred effects. Touch what you want and use your fingers to adjust the perimeters. Place the "target" directly on the subject to keep it sharp; Anything to it will be blurred. It is therefore possible to adjust the opening to change the quantity of blur. 4. Attachments for the test lenses for the eccentric effects treated with VSO with the E2 preset don't Keep how to use the Blur Photo app? So you should try using the objective attachments for that low field depth effect instead. The best options right now are the detachable magnetic lens tower Holga and the Lensbaby creative mobile devices kit. These goals are plastic that allow you to create blur with your camera. They can be expensive compared to the apps that only cost a few dollars. But they create interesting effects in real time without any changes necessary. Furthermore, they produce surprising results that you can't get through the retouching only. The Holga target tower is equipped with a phone case and is detachable. It has ten lenses to let you experience different blurred effects. Apart from that, it also has filters that allow you to shoot in different colors. To use it, all you have to do is turn the wheel and choose the optics you want to try. Meanwhile, Lensbaby has a more minimalist approach than Holga. It offers only two lenses that you can hook the phone. The first has a blurry vignette, while the other creates kaleidoscopic edges. This particular kit is more expensive than the Holga but has a better quality to add the lens blur. 3. Make your filters for even more creativity don't you buy attacks for lenses? Then consider the creation of do-it-yourself filters to reach blur. Experience to place different materials in front of your phone. Look what effect they have on your photos. To get blur in the picture above, I used a simple plastic button. I lined the hole with the phone lens to keep the nitid medium. Meanwhile, I leave the rest of the button surface to cover the goal for a fuzzy sticker. Of course, you don't have to stick to the buttons. It is also possible to try other materials such as glass slabs or transparent plastic surfaces. Position on the edge of the lens. And you have a photo that is partially blurred. If they have a hole in the middle as the button, lines them with the lens. The center remains sharp while the edges seem fuzzy. Whenever possible, do not cover the entire lens with the chosen filter. Otherwise, everything would end up blur. Make sure you leave a bit of space in front of your lens to keep some areas of your Sharp photo. 2. Connect your DSLR to your phone for blurred wallpapers for double cameras and blur apps may be impressive, but they are not perfect. Note that the blurred background overlaps with the subject in some areas. If you want to get a clean and professional appearance, consider using a DSLR. These days, most cameras are enabled WiFi. This means that you can synchronize your DSLR to your phone to check it and transfer photos to wireless mode. As a result, it is the perfect configuration to obtain blurred backgrounds. Now go like blurring a photo using your DSLR and your phone step by step. First, download the specific application for your camera. Then turn on the wifi of your camera and connect it to your iPhone via the app. Once See different settings on the phone screen. Choose openings and select a small value between F / 1.8 to F / 2.0. Subsequently, look for the shutter button on the interface of your device and take a picture. Due to the depth of field of the lens, you can expect the background to be blurred. But you don't have to use the phone to check your DSLR all the time during shooting. You are also free to take pictures with your yours And transfer the images to the phone later. It is therefore possible to modify the files to the device and share them on social media. Remember that every DSLR app is different. So it would be better to consult your manual for complete instructions. Applications also vary in functionality, so familiarize themselves before. 1. Use Photoshop to blur the background you don't have to limit yourself to blur the apps to edit your photos. You can also upload your image to your computer and retouch them using Photoshop. In addition to giving you more creative control, it also produces cleaner results. Photoshop's use may seem intimidating, but the process is quite simple. First, open the file in Photoshop. Then select the polygonal lapse tool or the pen tool for "Cut out" your subject. Once done, click on the Blur tool to blur the rest of the image. Since you have created a mask of yours Subject, you will be sharp even when you go with the blur tool. You can choose the amount of bokeh by adjusting the force cursor at the top of the screen. Select 30 or less it is preferable to keep some details in the background. Remember that there are many other ways To blur the background in Photoshop. This is just a basic method. Once you have familiar with steps, feel free to experiment even different options. Conclusion There are many ways to get background blur in your photos. Each method is it's different from another, so don't be afraid to use any of them to make the blurred effect you want. More experiences, plus your photo is unique your photos. Do you want to master the basics of photography so you can take stunning photos in any situation? If you don't know what the settings to use are, you will often be able to capture the beautiful moments. But the cameras are complicated and it is difficult to know where to start. This is why we created this course. My photographic composition Edit ideas ideas Creative ideas
